

AI Assistant

Discord Commands Guide

Learn how the AI Assistant Discord Bridge handles messages, greetings, commands, and custom Discord functionality.

1. How the Discord Bridge Works

The AI Assistant Discord Bridge receives messages from Discord and connects them to your selected AI Assistant.

It can:

- ✓ Receive Discord messages
- ✓ Respond to simple greetings
- ✓ Send normal messages to your AI Assistant
- ✓ Return AI responses to Discord
- ✓ Be customized with your own Discord commands

2. Built-in Greeting Responses

The current Discord Bridge recognizes several simple greetings.

Supported greetings are:

```
hi  
hello  
hey
```

For example:

```
You: hello  
Bot: Hi!
```

The exact reply may vary because the bridge randomly chooses between several short greeting responses.

```
Hi!  
Hey!  
Hello!
```

💡 These greetings are handled directly by the Discord Bridge and do not need to be sent to the AI service.

3. AI Messages

Messages that are not handled as simple greetings are forwarded to the AI Assistant service.

For example:

You: What information do you have about our return policy?

The Discord Bridge sends the message to the AI Assistant connected through your configured Assistant ID.

The AI response is then sent back to the Discord channel.

💡 The response depends on the AI Assistant you selected, including its connected knowledge and configuration.

4. Discord Commands

The Discord Bridge uses the `discord.ext.commands` framework.

This allows developers to add commands with a command prefix, such as:

!

A command can look like this:

```
@bot.command()
async def ping(ctx):
    await ctx.send("🏓 Pong!")
```

The command would then be entered in Discord as:

```
!ping
```

 Commands are separate from normal AI messages and can be customized directly in `bridge.py`.

5. Adding a Custom Command

You can add your own Discord commands to `bridge.py`.

For example, to create a welcome command:

```
@bot.command()
async def welcome(ctx):
    await ctx.send("👋 Welcome to the server!")
```

The command would then be:

```
!welcome
```

Save the file and restart the Discord Bridge after making changes.

6. Customizing a Command

You can change the reply sent by a command.

Example:

```
@bot.command()
async def status(ctx):
    await ctx.send("✅ AI Assistant Discord Bridge is online.")
```

After restarting the bridge, the command would be:

```
!status
```

7. Removing a Command

To remove a custom command, delete its command block from `bridge.py`.

For example:

```
@bot.command()
async def welcome(ctx):
    await ctx.send("👋 Welcome to the server!")
```

Delete the block, save the file, and restart the bridge.

8. Changing the Command Prefix

The current Discord Bridge is configured with:

```
bot = commands.Bot(command_prefix="!", intents=intents)
```

This means commands use `!`.

You can change the prefix in `bridge.py`.

For example:

```
bot = commands.Bot(command_prefix="?", intents=intents)
```

Commands would then use:

```
?welcome
?status
```

💡 Restart the Discord Bridge after changing the prefix.

9. Restricting Commands

If you add administrative commands, consider restricting who is allowed to use them.

Custom commands can be restricted using:

- Discord permissions
- User roles
- Channel restrictions
- Custom checks in your Python code

Security

Do not expose sensitive tokens, API credentials, private data, or administrative functionality through unrestricted commands.

10. Troubleshooting

The bot does not respond at all

- Make sure `bridge.py` is running.
- Verify your Discord Bot Token.
- Check that Message Content Intent is enabled.
- Check that the bot can view and send messages in the channel.

Greeting responses do not work

Try one of the supported greetings:

```
hi
hello
hey
```

Make sure the bridge is running and can read the channel.

✖ AI messages fail

- Check your AI Assistant API token.
- Check your AI Assistant ID.
- Make sure the selected AI Assistant still exists.
- Check the terminal for errors.
- Verify that the AI Assistant service is reachable.

✖ A custom command does not work

- Check the command spelling.
- Check the configured command prefix.
- Check your Python syntax.
- Restart the Discord Bridge after editing the file.

💡 11. Customization Ideas

Developers can extend the Discord Bridge with additional functionality.

Examples include:

- ★ Server information commands
- ★ Role-restricted commands
- ★ Status commands
- ★ Custom welcome messages
- ★ Server-specific utilities
- ★ Additional integrations

💡 Custom Python code is optional. The standard Discord Bridge can still be used to communicate with your AI Assistant without adding your own commands.

12. Need Setup Help?

For complete Discord installation and configuration instructions, use the:

 **AI Assistant - Discord Setup Guide**

The Setup Guide is available from the Discord Setup page.

Ready to Customize

 **Your Discord Bridge can be customized to fit your server.**

Start with simple changes, restart the bridge after editing, and test your changes in Discord.
