Discord Commands Guide

Updated for U5 | Built-in commands, mentions, DMs, and troubleshooting

1. Message flow

Discord member → Discord Bridge → authenticated AI Assistant backend → selected assistant → Discord Bridge → Discord reply. A response travels back to the initiating channel or DM; this is not a general dashboard-to-Discord broadcast feature.

2. Supported triggers

```
!ping
```

Connectivity check. Replies Pong! without an AI service request.

```
!ask What is 2 + 2?
```

Forwards the question to your selected AI Assistant. Requires backend availability and an active integration.

```
@YourBot What is 2 + 2?
```

Direct mention plus a question in a server channel.

```
DM: What is 2 + 2?
```

A direct message to the Discord bot. The bridge forwards DM text to the configured assistant.

Normal unaddressed server messages and greetings such as hello are not guaranteed to trigger an automatic greeting or AI response in this U5 bridge.

3. What the bridge uses

• discord.py handles Discord events and commands.

• The Discord integration secret authenticates the bridge with the U5 backend; it is not the general API Access token.

• DJANGO_BOT_ID identifies the selected AI Assistant. The assistant owner must retain Pro access.

• A running bridge and HTTPS backend connection are required for AI replies.

4. Optional custom commands

Advanced users may extend bridge.py with discord.py commands. Only !ping and the documented AI triggers above should be treated as built-in U5 behavior.

```
@bot.command()

async def status(ctx):

await ctx.send("Bridge online")
```

Custom commands require code changes, a restart and appropriate permissions. Ensure your on_message handler passes relevant command messages to bot.process_commands. Restrict any administrative commands by roles or permissions.

5. Troubleshooting

• !ping fails: verify that the bridge is online, Message Content Intent is enabled and the bot can read and send messages.

• !ask returns “configured assistant is unavailable”: check the deployed endpoint, integration status, assistant ID and Pro entitlement.

• !ask returns “AI service could not be reached”: check backend AI provider configuration and availability. Backend service credentials are managed by the service operator (for example, Heroku Config Vars), not supplied by Discord members.

• Keep Discord Bot Tokens and Discord integration secrets private; do not expose them in commands, screenshots or repositories.

6. Scope of two-way communication

Supported: Discord user asks a question; AI Assistant returns an answer to Discord. Not established by this guide: automatically synchronizing every website chat, sending unsolicited outbound messages to Discord, or mirroring all dashboard conversations. These would require separate functionality.
