

AI Assistant Setup Guide

Version 3 • Create it. Teach it. Chat with it.

AI Assistant Setup Guide

Welcome! AI Assistant lets you create a personalized AI helper for studying, coding, writing, customer support, documents, and more. This updated guide covers the new customization options and how to navigate your assistants.

1. Create Your AI Assistant

Select Create Assistant, choose a meaningful name, and describe what you want it to help you with. You can create assistants for different purposes, subject to your plan's assistant limit.

- Study Assistant: explains course material and provides examples.
- Coding Helper: supports debugging and technical questions.
- Customer Support: answers questions about your products and services.
- Knowledge Assistant: works with your uploaded documents.

2. Choose a Clear Name and Purpose

Names such as Product Expert or Travel Planner make assistants easier to recognize. Be specific about the job: instead of “Help me with stuff,” try “Explain my study material using simple examples.”

3. Personality and Basic Customization — All Plans

Every plan includes the core tools for shaping an assistant's behavior:

- Personality and instructions: describe its role and how it should help.
- Response tone: choose an appropriate tone for answers.
- Response length: select shorter or more detailed replies.
- Avatar icon: give the assistant a recognizable visual identity.
- Knowledge activation mode: control when its uploaded knowledge is used.
- Automatic response language: let the assistant respond according to the conversation.

4. Advanced Customization — Premium and Pro

Premium and Pro add more precise control over the assistant's communication:

- Communication style: refine the way the assistant speaks.
- Response structure: influence how answers are organized.
- Fixed default language: set a preferred response language.
- Proactivity: adjust how proactively the assistant helps.
- Custom instructions: provide additional detailed guidance.

On Free: these advanced controls are not available. If you downgrade from Premium or Pro, previously saved advanced values are retained for a future upgrade but are not applied while your plan is Free.

5. Add Your Own Knowledge

Upload supported documents to an assistant's Knowledge Base. It can then retrieve relevant information from those documents when answering questions.

- Useful examples: manuals, company information, policies, study material, personal notes, and project documentation.
- Ask questions such as: “How do I reset this product?” or “Summarize the important information in my documents.”

Knowledge belongs to the assistant it was uploaded to. Storage allowances depend on your plan.

Upload only material you are authorized to store and use.

6. Navigate Your Assistants and Conversations

In the updated mobile layout, open the Main Menu, expand Assistants, select an assistant, and then open its Conversations. Individual assistant options appear when you expand that assistant.

This hierarchy keeps assistant-specific actions and chat histories organized. Start a new conversation or return to an existing one from the relevant assistant.

7. Start Chatting

Once your assistant is ready, ask questions, request explanations, generate drafts, or work with

your Knowledge Base.

- “Explain this like I'm a beginner.”
- “Help me understand this code.”
- “What does our product documentation say about installation?”

Chat availability and monthly AI-message allowances are determined by your plan. Check your account's plan information for current limits.

8. Choose the Plan That Fits You

Free: get started with a personal assistant and basic customization.

Premium: unlock Advanced Customization and increased plan allowances.

Pro: includes Advanced Customization plus Website Widget / Public Chatbot capabilities and the option to remove AI Assistant branding from the public website widget.

Pricing: consult the current pricing page or the purchase screen for the applicable amount and currency. Prices can vary by platform and region.

Some integrations and future features may appear in plans or roadmaps; do not assume an integration is live

unless it is available in your account.

9. Share Your Assistant — Pro

Pro's Website Widget / Public Chatbot lets you make an assistant available to visitors. Where enabled, share its public link or copy the embed code from Widget Settings to place it on your website.

- Separate sessions: each visitor has an independent conversation.
- Saved history: visitor conversations appear in the owner's Conversations area and are read-only for the owner.
- Usage: visitor messages count toward the owner's monthly AI-message allowance.
- Branding: Pro can remove AI Assistant branding from the public website widget; this does not change branding throughout the rest of the product.

Before enabling public access: review your assistant's instructions and uploaded knowledge.

Anyone with access to an enabled public chatbot may ask it questions. Disable the widget again in Widget Settings when needed.

10. Tips for Better Answers

- Be specific: describe the result you need and provide context.
- Keep knowledge relevant: upload documents related to the assistant's purpose.
- Refine instructions: improve the assistant's setup based on actual results.
- Verify important information: AI output may be inaccurate, especially for legal, medical, financial, or business-critical decisions.

11. Remember the Simple Formula

Create it. Give your assistant a clear purpose. Teach it. Add relevant knowledge. Chat with it. Ask questions. Improve it. Adjust settings as you learn what works.

You're ready! Create your assistant, add your knowledge, and start chatting.
